(Dated: May 9, 2018)

We develop the explicit expressions for rotating the nonlinear susceptibility tensor  $\chi(-2\omega; \omega, \omega)$  through any arbitrary angle. Each component in the rotated frame of reference is a combination of different components from the non-rotated system; setting the angle of rotation to  $\pi/2$  is equivalent to no rotation whatsoever.

To take the components of  $\chi(-2\omega; \omega, \omega)$  from the crystallographic frame to the lab frame, we can simply apply a standard rotational matrix,

$$R = \begin{pmatrix} R_{Xx} & R_{Xy} & R_{Xz} \\ R_{Yx} & R_{Yy} & R_{Yz} \\ R_{Zx} & R_{Zy} & R_{Zz} \end{pmatrix} = \begin{pmatrix} \sin \Phi & -\cos \Phi & 0 \\ \cos \Phi & \sin \Phi & 0 \\ 0 & 0 & 1 \end{pmatrix},$$

such that

$$\chi^{IJK} = \sum_{ijk} R_{Ii} R_{Jj} R_{Kk} \chi^{ijk},$$

where  $I, J$ , and  $K$  ( $i, j, k$ ) cycle through  $X, Y$ , or  $Z$  ( $x, y, z$ ). Fig. 1 depicts this rotation over any arbitrary combination of angles  $\Theta$  and  $\Phi$ ; however, in this work we will only consider a rotation in the  $xy$ -plane along  $\Phi$ .

FIG. 1: The translation from the non-rotates  $xyz$  coordinates to the rotated  $XYZ$  system. In this work, we will only consider an in-plane rotation of  $\Phi$ .

Thus, our  $\chi^{IJK}$  components in terms of the original  $ijk$  coordinate system are

$$\begin{aligned}
\chi^{XXX} &= \sin^3 \Phi \chi^{xxx} + \sin \Phi \cos^2 \Phi \chi^{xyy} - 2 \sin^2 \Phi \cos \Phi \chi^{xxy} \\
&\quad - \sin^2 \Phi \cos \Phi \chi^{yxx} - \cos^3 \Phi \chi^{yyy} + 2 \sin \Phi \cos^2 \Phi \chi^{yyx}, \\
\chi^{XXY} &= \sin \Phi \cos^2 \Phi \chi^{xxx} + \sin^3 \Phi \chi^{xyy} + 2 \sin^2 \Phi \cos \Phi \chi^{xxy} \\
&\quad - \cos^3 \Phi \chi^{yxx} - \sin^2 \Phi \cos \Phi \chi^{yyy} - 2 \sin \Phi \cos^2 \Phi \chi^{yyx}, \\
\chi^{XZZ} &= \sin \Phi \chi^{xzz} - \cos \Phi \chi^{yzz}, \\
\chi^{XYZ} &= \chi^{XZY} = \sin^2 \Phi \chi^{xyz} + \sin \Phi \cos \Phi \chi^{xxz} - \sin \Phi \cos \Phi \chi^{yyz} - \cos^2 \Phi \chi^{yxz}, \\
\chi^{XXZ} &= \chi^{XZX} = -\sin \Phi \cos \Phi \chi^{xyz} + \sin^2 \Phi \chi^{xxz} + \cos^2 \Phi \chi^{yyz} - \sin \Phi \cos \Phi \chi^{yxz}, \\
\chi^{XXY} &= \chi^{XYX} = \sin^2 \Phi \cos \Phi \chi^{xxx} - \sin^2 \Phi \cos \Phi \chi^{xyy} + (\sin^3 \Phi - \sin \Phi \cos^2 \Phi) \chi^{xxy} \\
&\quad - \sin \Phi \cos^2 \Phi \chi^{yxx} + \sin \Phi \cos^2 \Phi \chi^{yyy} + (\cos^3 \Phi - \sin^2 \Phi \cos \Phi) \chi^{yyx},
\end{aligned} \tag{1}$$

for the  $\chi^{XJK}$  components,

$$\begin{aligned}
\chi^{YXX} &= \sin^2 \Phi \cos \Phi \chi^{xxx} + \cos^3 \Phi \chi^{xyy} - 2 \sin \Phi \cos^2 \Phi \chi^{xxy} \\
&\quad + \sin^3 \Phi \chi^{yxx} + \sin \Phi \cos^2 \Phi \chi^{yyy} - 2 \sin^2 \Phi \cos \Phi \chi^{yyx}, \\
\chi^{YYY} &= \cos^3 \Phi \chi^{xxx} + \sin^2 \Phi \cos \Phi \chi^{xyy} + 2 \sin \Phi \cos^2 \Phi \chi^{xxy} \\
&\quad + \sin \Phi \cos^2 \Phi \chi^{yxx} + \sin^3 \Phi \chi^{yyy} + 2 \sin^2 \Phi \cos \Phi \chi^{yyx}, \\
\chi^{YZZ} &= \cos \Phi \chi^{xzz} + \sin \Phi \chi^{yzz}, \\
\chi^{YYZ} &= \chi^{YZY} = \sin \Phi \cos \Phi \chi^{xyz} + \cos^2 \Phi \chi^{xxz} + \sin^2 \Phi \chi^{yyz} + \sin \Phi \cos \Phi \chi^{yxz}, \\
\chi^{YXZ} &= \chi^{YZX} = -\cos^2 \Phi \chi^{xyz} + \sin \Phi \cos \Phi \chi^{xxz} - \sin \Phi \cos \Phi \chi^{yyz} + \sin^2 \Phi \chi^{yxz}, \\
\chi^{YXY} &= \chi^{YYX} = \sin \Phi \cos^2 \Phi \chi^{xxx} - \sin \Phi \cos^2 \Phi \chi^{xyy} + (\sin^2 \Phi \cos \Phi - \cos^3 \Phi) \chi^{xxy} \\
&\quad + \sin^2 \Phi \cos \Phi \chi^{yxx} - \sin^2 \Phi \cos \Phi \chi^{yyy} + (\sin^3 \Phi - \sin \Phi \cos^2 \Phi) \chi^{yyx},
\end{aligned}$$

for the  $\chi^{YJK}$  components, and lastly

$$\begin{aligned}
\chi^{ZXX} &= \sin^2 \Phi \chi^{zxx} + \cos \Phi \cos \Phi \chi^{zyy} - 2 \sin \Phi \cos \Phi \chi^{zxy}, \\
\chi^{ZYY} &= \cos^2 \Phi \chi^{zxx} + \sin^2 \Phi \chi^{zyy} + 2 \sin \Phi \cos \Phi \chi^{zxy}, \\
\chi^{ZZZ} &= \chi^{zzz}, \\
\chi^{ZYZ} &= \chi^{ZZY} = \sin \Phi \chi^{zyz} + \cos \Phi \chi^{zxx}, \\
\chi^{ZXZ} &= \chi^{ZZX} = -\cos \Phi \chi^{zyz} + \sin \Phi \chi^{zxx}, \\
\chi^{ZXY} &= \chi^{ZYX} = \sin \Phi \cos \Phi \chi^{zxx} - \sin \Phi \cos \Phi \chi^{zyy} - \cos 2\Phi \chi^{zxy},
\end{aligned}$$

for the  $\chi^{ZJK}$  components. Fortunately, the intrinsic permutation symmetry of SHG is also present in the new coordinate system, such that  $\chi^{IJK} = \chi^{IKJ}$ ; therefore, there are only 18 unique components in either system. Setting  $\Phi = \pi/2$  signifies that there is no rotation, and thus  $\chi^{IJK} = \chi^{ijk}$ .

FIG. 2:  $\chi^{XXX}$  for three values of  $\Phi$  calculated for a system with  $C_{3v}$  symmetry.

It should also be clear that the crystal symmetries do **not** follow into the rotated system. For instance, the  $C_{3v}$  symmetry satisfies the following,

$$\begin{aligned}\chi^{xxx} &= -\chi^{xyy} = -\chi^{yxy}, \\ \chi^{yxx} &= \chi^{yyy} = 0.\end{aligned}$$

In the rotated system, the top relationship holds true such that  $\chi^{XXX} = -\chi^{XYY} = -\chi^{YXY}$ . However, we also obtain that

$$\chi^{YYY} = \cos 3\Phi \chi^{xxx},$$

which is most definitely not zero. Fortunately, we can simply apply the crystal symmetry to the non-rotated system before transforming to the rotated system.

As an example case, we present  $\chi^{XXX}$  for three values of  $\Phi$  for a system with  $C_{3v}$  symmetry in Fig. 2. The nonzero components in the original coordinates are presented in Fig. 3, multiplied by the appropriate prefactors from Eq. (1). We can see how we recover the component in the original coordinates when  $\Phi = \pi/2$ .
